## IN THE CLAIMS

This listing of claims replaces all prior listings:

 (Previously Presented) A positive electrode active material comprising coated particles, each coated particle having a layered structure with an inner particle having an outer surface covered at least in part by a coating layer, wherein:

said inner particle is a first compound oxide that includes  $LiNi_{0.70}Mn_{0.30}O_2$  and  $LiNi_{0.70}Co_{0.30}O_2$  and said inner particle is capable of doping and undoping lithium;

said coating layer is adhered to said outer surface and comprises a homogenous second compound oxide having a spinel structure in the cubic system of lithium and titanium selected from the group consisting of Li<sub>4</sub>Ti<sub>4</sub>O<sub>12</sub>, Li<sub>2</sub>TiO<sub>3</sub>, Li<sub>2</sub>TiO<sub>3</sub>, Li<sub>2</sub>TiO<sub>3</sub> and Li<sub>4</sub>Ti<sub>4</sub>O<sub>9</sub>Mn<sub>0.10</sub>O<sub>12</sub>: and

said coating layer effectively suppresses decomposition of electrolyte in contact therewith and maintains the conductivity of lithium ions in the positive electrode active material.

- (Original) The positive electrode active material according to claim 1, wherein the ratio by weight of the first compound oxide to the second compound oxide is between 96:4 and 65:35.
  - (Cancelled)
- (Original) The positive electrode active material according to claim 1, wherein the positive electrode active material has a mean particle diameter of 5 to 20 

  µm.
- 5. (Previously Presented) A non-aqueous electrolyte secondary battery comprising a positive electrode active material and a negative electrode active material, the positive active material comprising coated particles, each coated particle having a layered structure with an inner particle having an outer surface covered at least in part by a coating layer, wherein:

said inner particle is a first compound oxide that includes  $LiNi_{0,70}Mn_{0,30}O_2$  and  $LiNi_{0,70}Co_{0,30}O_2$  and said inner particle is capable of doping and undoping of lithium;

Response to November 5, 2009 Office Action Application No. 10/821,323 Page 3

said coating layer is adhered to said outer surface and comprises a second compound oxide of lithium and titanium having a spinel structure in the cubic system selected from the group consisting of Li<sub>4</sub>Ti<sub>5</sub>Q<sub>12</sub>, Li<sub>2</sub>Ti<sub>Q</sub>, Li<sub>2</sub>Ti<sub>3</sub>Q<sub>7</sub> and Li<sub>4</sub>Ti<sub>4</sub>q<sub>9</sub>Mn<sub>0,10</sub>Q<sub>12</sub>; and

said coating layer effectively suppresses decomposition of electrolyte in contact with the active material and maintains conductivity of lithium ions in the active material.

- (Previously Presented) A coated particle according to claim 1, wherein said coating layer and outer surface are fused by mechanofusion.
- 7. (Previously Presented) The layered particle according to claim 6, wherein said inner particle compound and said coating layer compound are mixed in a 90:10 weight ratio.

- 3 -
